

## Long March 5B

Long March 5B was the workhorse during the Tiangong space station construction. The second Long March 5B mission was the launch of Tianhe core module, the first component of the Chinese space station.

The Long March-5B is a modified version of Long March-5 rocket and will be China's first 1.5-stage large carrier rocket.

The rocket is 53.7 meters long ( which is as tall as an 18-floor building), with a diameter of five meters and a liftoff weight of 849 metric tons. It uses pollution-free propellant including liquid oxygen, liquid hydrogen and kerosene. It has a carrying capacity of more than 22 tons in low-Earth orbit. It has the largest carrying capacity in low-Earth orbit among all Chinese rockets.
