

Gluing Legs to the Tripod

DO NOT glue the telescope into the tripod until you do this first...

- Cut a plastic or wood skewer at **5 inches long** for the Refractor Telescope. Glue to thick card for stability. MAKE SURE THE ENDS ARE CUT STRAIGHT AND PARALLEL TO THE TABLE.
- Place the **tripod base** on top, hold and glue one leg at a time onto the tripod base and let dry. Bottom of the legs should rest on the table.
- Cut down to a little over **4 1/2 inches long** and do the same for the Reflector Telescope tripod.

This should make sure that the legs are glued perfectly level with the table.
